Azure Terraform Modules

Create the **azure-modules** directory.

The folder structure for the above-created directory is as follows:

```
azure-modules
├──aks
├──container-apps
├──mssql
├──mysql-flexible
├──resource-group
└──virtual-network
```

Resource Group Module

Let's start with the Resource Group Module.

1. Create a *resource-group* folder inside the above-created directory.
2. Inside *resource-group* folder, create *main.tf* file.
3. Define the following resources:
    - azurerm_resource_group
4. Click code for reference.
5. The definition of *main.tf* file has been completed.
6. Now we will create *variables.tf* file for declaring variables.
7. Inside it, declare the following variables:
    - resource-group-properties
8. Click code for reference.
9. We have completed defining the **Resource Group Module**.

VNet Module

Now, let's create a Virtual Network module.

1. Create a *vnet* folder inside the above-created directory.
2. Inside *vnet* folder, create *main.tf* file.
3. Define the following resources:
    - azurerm_virtual_network
4. Click code for reference.
5. The definition of *main.tf* file is completed.
6. Now we will create *variables.tf* file for declaring variables.
7. Inside it, declare the following variables:
    - virtual-network-properties
    - resource-group-properties

8. Click code for reference.
9. We have completed declaring *variables.tf* file for the *VNet module*.
10. Now we will declare outputs for the *VNet module*.
11. Create *outputs.tf* file and add the following outputs:
    - azurerm_virtual_network.vnet.id
    - azurerm_virtual_network.vnet.name
12. Click code for reference.
13. Now we have completed defining the **VNet Module**.

MySQL Flexible Module

For the database, we will use Azure MySQL Flexible.

1. Create *mysql-flexible* folder inside the *azure-modules* directory.
2. Inside *mysql-flexible* folder, create *main.tf* file and define the following resources:
    - azurerm_subnet
    - azurerm_private_dns_zone
    - azurerm_private_dns_zone_virtual_network_link
    - azurerm_mysql_flexible_server
    - azurerm_mysql_flexible_database
3. Click code for reference.
4. The definition of *main.tf* file is complete.
5. Now we will create *variables.tf* file.
6. Inside the *variables.tf* file, declare the following variables:
    - mysql-flexible-properties
    - resource-group-properties
    - vnet-id
    - vnet-name
7. Click code for reference.
8. Variables have been declared, now we will define the outputs.
    - DB_HOST
9. Click code for reference.
10. We have completed defining the **MySQL Flexible Module**.

Container Apps Module

Let's start with the Container Apps Module.

1. Create *container-apps* folder in the above-created *azure-modules* directory.
2. Inside it, create *main.tf* file and define the following resources;
    - azurerm_subnet
    - azurerm_log_analytics_workspace
    - azurerm_container_app_environment
    - azurerm_container_app
3. Click code for reference.
4. The definition of *main.tf* file for *Container Apps* is complete.

5. Now create *variables.tf* file and declare the following variables:
    - container-app-properties
    - resource-group-properties
    - vnet-name
6. Click code for reference.
7. The definition of **Container Apps Module** is complete.

AKS Module

Let's start with the AKS Module.

1. Create the *aks* folder in the *azure-modules* directory.
2. Inside it, create a *main.tf* file and define the following resources:
    - azurerm_subnet
    - azurerm_kubernetes_cluster
3. Click code for reference.
4. The *main.tf* file for AKS has been defined.
5. Now we will create *variables.tf* file and declare the following variables:
    - aks-properties
    - resource-group-properties
    - vnet-name
6. Click code for reference.
7. We have completed defining the **AKS Module**.
