

ECS Provisioning using Terraform

- We will provision the ECS using Terraform as an Infrastructure as Code.
 - We will deploy it in a custom Virtual Private Cloud for isolation.
 - We will connect the Container App to ECR for Docker Image.
 - We will also create S3 bucket to store the `.env` file.
 - Also will deploy RDS MySQL Instance to store the relational data and connect it to ECS.
-

Prerequisites

1. AWS Account with an IAM User with administrative permissions.
 2. Terraform installed.
-

Steps

1. Create the **ecs-terraform** directory.
2. The folder structure for the above-created directory is as follows:

```
ecs-terraform
├── .terraform.lock.hcl
├── locals.tf
├── main.tf
├── outputs.tf
├── providers.tf
├── terraform.tfstate
├── terraform.tfstate.backup
└── .terraform
```

We need to only create *providers.tf*, *main.tf*, *outputs.tf*, & *locals.tf* file. Other files are generated while initiating terraform.

3. Create a *providers.tf* file inside the above-created directory.
4. Inside it, define the following:
 - terraform
 - required_providers
 - provider
 - docker
 - aws
5. Click [code](#) for reference.
6. The definition of *providers.tf* file is complete.
7. Now, create the *main.tf* file.
8. Inside *main.tf* file, we will use the following predefined modules:
 - vpc
 - s3

- rds
 - ecr
 - load-balancer
 - ecs
9. Also define the following s3 resource for uploading local .env file:
 - aws_s3_object
 10. Click [code](#) for reference.
 11. The definition of *main.tf* file is complete.
 12. Now we will create *outputs.tf* file.
 13. Inside it, define the following outputs.
 - DB_HOST
 - bastion-host-ip
 14. Click [code](#) for reference.
 15. The definition of *outputs.tf* file is complete.
 16. Now we will create *locals.tf* file.
 17. Inside it, define the following variables:
 - vpc-properties
 - s3-properties
 - database-properties
 - bastion-properties
 - load-balancer-properties
 - ecs-properties
 18. Click [code](#) for reference.
 19. The definition of *locals.tf* file is complete.

Ensure you give the appropriate values to the variables defined in *locals.tf* file.

Also, update the *s3-object-source-path* variable under *s3-properties* with local .env file relative path.

Provisioning the Infrastructure

Now we will provision the AWS infrastructure by applying the above-created configuration files.

Ensure AWS CLI is configured with appropriate AWS user credentials with enough permissions.

Steps:

1. Open the PowerShell.
2. Change the directory to the above-created **ecs-terraform** directory using **cd** command.
3. Run the **terraform fmt -recursive** command to format the syntax of the files.
4. Run the **terraform init** command to initialize the *terraform*.
5. Run the **terraform validate** command to validate the configuration files.
6. Run the **terraform plan** command to plan the resources to be created.
7. Run the **terraform apply** command and if prompted, type **yes** to provision the infrastructure.
8. Run the **terraform output** command to get the values of defined variables in *outputs.tf* file.
9. Head to the AWS Console, and verify the created resources.
10. Then,

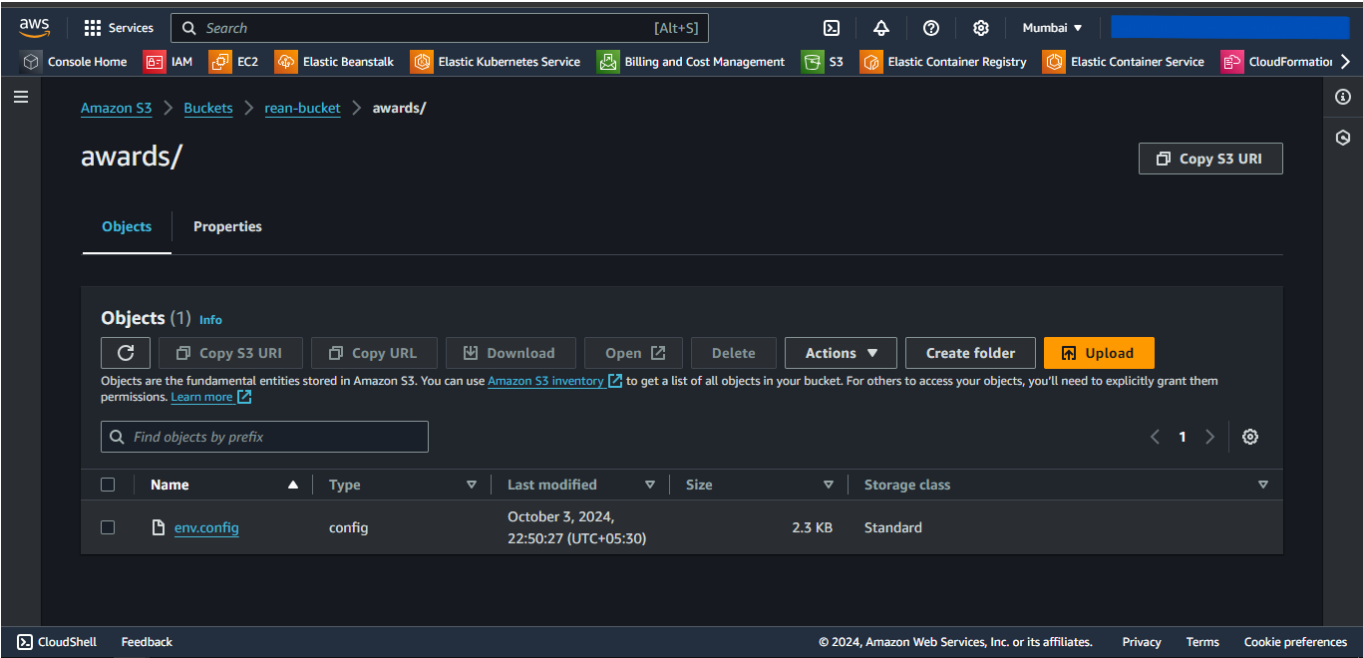

- Head towards EC2 dashboard.
- Select *Load Balancers*, and select the created load balancer.
- Copy the DNS address.
- Paste the address in the browser to access the application.

Connection to the RDS database through Bastion Host using MySQL Workbench

1. Open MySQL Workbench.
2. Click Add Connection.
3. Select connection method as **Standard TCP/IP over SSH**.
4. In SSH Hostname, enter *bastion-host-ip:22* where *bastion-host-ip* is received from the **terraform output** command.
5. In SSH Username, enter *ec2-user*.
6. In SSH Key File, select *bastion-key.pem* file passed in above *locals.tf* file from your local computer.
7. In MySQL Hostname, enter *DB_HOST* where *DB_HOST* is received from the **terraform output** command.
8. In the Password section, select *Store in Vault*, and enter the password passed in above-created *locals.tf* file.
9. Click OK and open the connection.
10. Now you can run MySQL commands to access databases and verify the successful connection of *ecs-container*.

Destroy the provisioned infrastructure

1. To destroy infrastructure, open the Powershell Window and change the directory to the above-created **ecs-terraform** directory using the **cd** command.
 2. Run **terraform destroy** & if prompted, type **yes**.
 3. Infrastructure will be destroyed.
-
